

Dagrofa Foodservice

At mySupply, we specialize in developing software integration solutions. Whether you are looking for a simple or advanced solution, we can work together to solve the task.

For many years, Dagrofa FoodService has been using the VAX platform for the exchange of electronic documents. All of our companies are connected to the service, and a large number of our customers and suppliers also use NemHandel. We have a good overview of our outstanding invoices because we can quickly see if our partners have received and paid the invoices.

– René Hornslev - Dagrofa Foodservice

Challenge

Dagrofa FoodService faced the challenge of establishing itself as an independent entity within the Dagrofa Group. This meant, among other things, that existing IT solutions, including the sending and receiving of electronic orders and invoices, needed to be adapted to the new circumstances.

Dagrofa FoodService uses both EDIFACT and OIOUBL and employs multiple operators and solutions in this area. Additionally, different ERP solutions are used in the various companies within the group. They wanted to optimize and streamline the exchange of the many different formats through multiple operators and standardize interfaces to the different ERP systems.

Since it is important to deliver orders and invoices on time to certain suppliers and customers, there was a need to have a real-time overview of the processing and delivery of the documents.

Dagrofa FoodService chose to initiate a collaboration with mySupply to address this task.

Solution

A common solution based on mySupply's VAX Integrator platform was established. The solution was configured to handle both EDIFACT and OIOUBL documents.

To standardize interfaces to the different ERP systems, an order and invoice format based on the upcoming CEN standard, used in the international Peppol platform, was developed. This format is implemented in the respective ERP systems. In VAX Integrator, this format is converted to either OIOUBL or EDIFACT, depending on the preferences of the individual recipient. If a recipient cannot receive electronic documents, the document is converted to PDF and sent via email.

The ERP systems are also connected to the document archive in VAX Integrator, ensuring that all sent and received documents are archived there.

Furthermore, a monitoring tool has been developed to continuously monitor incoming and outgoing documents, providing an ongoing overview of the status of received and sent documents.

Customer Testimonial

mySupply, with their extensive expertise in both EDIFACT and OIOUBL, has been a great collaborative partner. They have provided valuable advice and guidance on possible solutions and have been able to deliver these to our full satisfaction.

mySupply has also been of great assistance in our discussions with customers and suppliers regarding the transition to the new setup.

We have now streamlined our business processes and established a cohesive platform that we can optimize and further develop across the various group companies and ERP systems.
